**Fig. 12 for Question 8****Acid Rain fact file**

- Pollutants such as sulfur dioxide and nitrogen oxide are produced by human activity. These gases rise into the atmosphere and dissolve in water droplets in the clouds.
- This makes the water droplets become weak acid that later falls as acid rain.
- The acidic water droplets are blown by the prevailing wind so the effects of acid rain occur in different areas to those where the gases are created.
- The strength of acid rain is measured on the pH scale.
